Other Site Characteristics

Il sito è costituito dalla ex Valle del Mezzano finita di prosciugare alla fine degli anni '60. L'area è pressochè disabitata e attualmente caratterizzata da estesi seminativi inframezzati da una fitta rete di scoli, fossati e siepi alberate frangivento; ai suoi margini vi sono ampi canali e zone umide residue (Bacino di Bando, Vallette di Portomaggiore, Anse Vallive di Ostellato) scampate al prosciugamento. Su almeno 200 ettari sono stati ripristinati negli anni '90 stagni, prati umidi e praterie attraverso l'applicazione di misure agroambientali.

4.2 Quality and importance

Le specie nidificanti di maggior pregio (*Botaurus stellaris*, *Ardea purpurea*, *Nycticorax nycticorax*, *Platalea leucorodia*, *Circus aeruginosus*, *Acrocephalus melanopogon*) si concentrano nelle zone umide o in zone umide esterne contigue al sito. *Glareola praticola* nidifica nelle superici a set aside, nelle praterie umide create su terreni ritirati dalla produzione applicando misure agroambientali comunitarie e nelle vaste aree coltivate a pomodoro. *Circus pygargus* nidifica nelle coltivazioni di grano e nelle praterie umide create su terreni ritirati dalla produzione applicando misure agroambientali comunitari. Importanti gli svernamenti di *Egretta alba*, *Anser spp.*, *Asio flammeus*. Inoltre da rilevare l'importanza del sito per l'alimentazione di *Gelochelidon nilotica* che nidifica nelle Valli di Comacchio con il 50% della popolazione italiana. Il sito ospita la più importante popolazione italiana di *Falco vespertinus*.

4.3 Threats, pressures and activities with impacts on the site

The most important impacts and activities with high effect on the site
