Allo scopo di accertare la natura litologica, idrogeologica e fisico-meccanica dei terreni che ospiteranno le fondazioni dell'opera in progetto, come premesso, è stata effettuata un'indagine geognostica consistita in n° 2 penetrometrie statiche (CPT1 e CPT2).

Le prove sono state effettuate mediante l'utilizzo di un penetrometro statico tipo "Gouda" con cella di carico da 20 tonnellate, dotato di punta meccanica conica (tipo Begemann) avente angolo di apertura di 60° ed una sezione di 10 cm² e del manicotto di frizione "Friction Jacket" per la misura della resistenza di attrito laterale locale.

La lunghezza delle aste del penetrometro è di 1.00 metro e ogni 20 cm vengono eseguite: la misura della resistenza di punta (Rp) e dell'attrito laterale locale (Ral) i cui valori vengono poi riportati, in forma diagrammatica, negli appositi moduli.

Nei diagrammi figurano:

- 1) La curva di resistenza alla punta "Rp" che si riferisce ai dati della resistenza offerta dal terreno all'avanzamento della punta conica che esprime i valori dei carichi di rottura dei materiali attraversati.
- 2) La curva di resistenza di attrito laterale "Ral" che si riferisce alla resistenza di attrito locale misurata mediante il manicotto di frizione.

da - 5.80 m a - 6.40 m	Sabbie poi ghiaie	(Rp > 350 Kg / cm ²)

CPT n° 2

da - 0.00 m a - 0.60 m	Terreno di riporto e suolo	(Rpm = -- Kg / cm ²)
da - 0.60 m a - 1.60 m	Argille scarsamente limose	(Rpm = 24 Kg / cm ²)
da - 1.60 m a - 2.60 m	Argille scarsamente limose caratterizzate da valori di resistenza alla penetrazione leggermente inferiori	(Rpm = 17 Kg / cm ²)
da - 2.60 m a - 4.40 m	Argille limose	(Rpm = 15 Kg / cm ²)
da - 4.40 m a - 5.40 m	Limi sabbiosi e sabbie limose	(Rpm = 70 Kg / cm ²)
da - 5.40 m a - 6.20 m	Sabbie poi ghiaie	(Rpm > 360 Kg / cm ²)

Per quanto riguarda la situazione idrogeologica è stata riscontrata l'assenza di falda superficiale all'interno dei fori relativi a entrambe le prove.

Le due prove penetrometriche eseguite mostrano l'esistenza di una buona correlabilità tra le due colonne stratigrafiche in quanto vengono intercettati all'incirca le stesse litologie a profondità confrontabili.

Complessivamente si tratta di argille, argille limose, sabbie e sabbie limose; alla profondità di -6.20/-6.40 m è stato intercettato un orizzonte sabbioso-ghiaioso che è risultato impenetrabile, non consentendo l'avanzamento delle prove.

da - 4.40 m a - 5.40 m	Limi sabbiosi e sabbie limose	(Rpm = 70 Kg / cm ²)
da - 5.40 m a - 6.20 m	Sabbie poi ghiaie	(Rpm > 360 Kg / cm ²)

Per quanto riguarda la situazione idrogeologica è stata riscontrata l'assenza di falda superficiale all'interno dei fori relativi a entrambe le prove.

Le due prove penetrometriche eseguite mostrano l'esistenza di una buona correlabilità tra le due colonne stratigrafiche in quanto vengono intercettati all'incirca le stesse litologie a profondità confrontabili.

Complessivamente si tratta di argille, argille limose, sabbie e sabbie limose; alla profondità di -6.20/-6.40 m è stato intercettato un orizzonte sabbioso-ghiaioso che è risultato impenetrabile, non consentendo l'avanzamento delle prove.
